Process & Insights

- Found inspiration from different portfolio sites

- Used low-fidelity wireframes to get general layout

- Created high-fidelity wireframes using FIGMA to get a good picture of the look and the feel of the site

- Coded the content of the site using HTML, then added styling using CSS and a bit of JavaScript

- Used GitHub to update and host site

- User tested with 5 participants and uncovered usability issues

- Tested with all of the common browsers and at multiple screen sizes and break-points

- Used Linters to check code for any errors

These are the two prototypes I went off while coding my site. I originally wanted to go with a dark background, but after seeing it live, I decided to switch the color sceme for better legibility. The footer also changed to give the site more balance.
